

Performance Monitor for Oracle

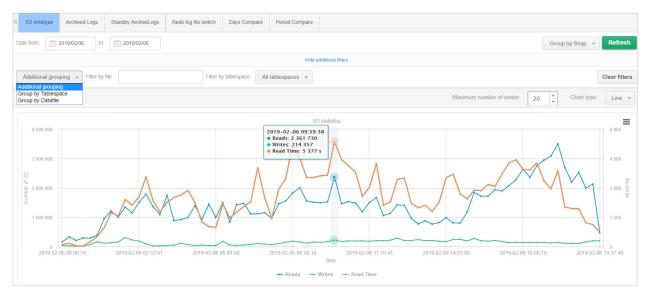

I/O Analyze

DBPLUS better performance

The I/O module allows you to verify the occurrence of performance problems on disk devices.

It is possible to compare the performance of reads and writes for a selected period of time, grouped by one of the selected options:

- Snap (15 minutes)
- Hour
- Day
- Month
- No grouping

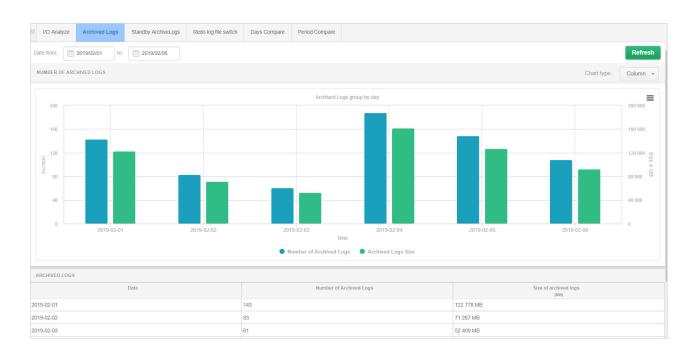

INPUT:OUTPUT STATISTICS									ction
LogDate -	Reads	Writes	Block Read	Block Written	Read Time [Seconds]	Write Time [Seconds]	Block Read Time [Seconds]	Block Write Time [Seconds]

Archived Logs

DBPLUS better performance

On the screen, you can read the number of **arch** files and their size for a given period of time.

Data are grouped by the **hour** as well as by the **day**.

Standby ArchiveLogs

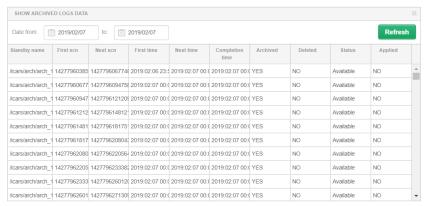

DBPLUS better performance

On the screen, you can see information about the status of the current data in the **Standby** database.

For the Standby database, the **delay time** as well as the **number of files** to be loaded in relation to production data are visible.

After clicking on the **Archived log** icon, you can see additional information about the arch files.

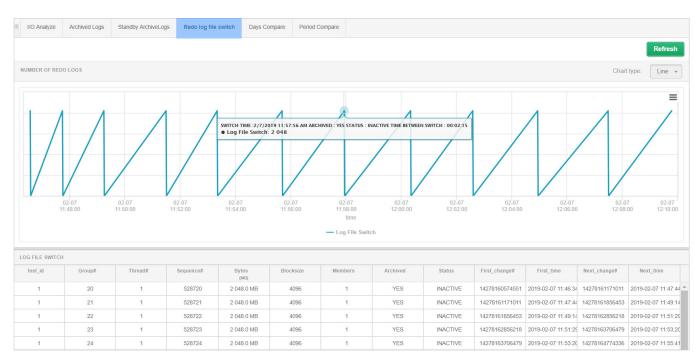

Redo log file switch

The screen shows information about changes to the **Redo log** files.

The data contains, among others, information on:

- Size of the file
- Archiving
- Status
- Date First_time
- Date Next_time

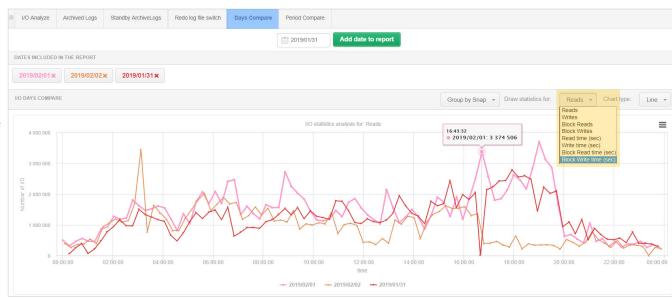

Days Compare

Compare is a module that allows you to compare a given **day** or **period** with another one indicated in the history.

The comparison can be made for all available I/O meters.

The information is grouped in **hourly** and **15-minute** samples.

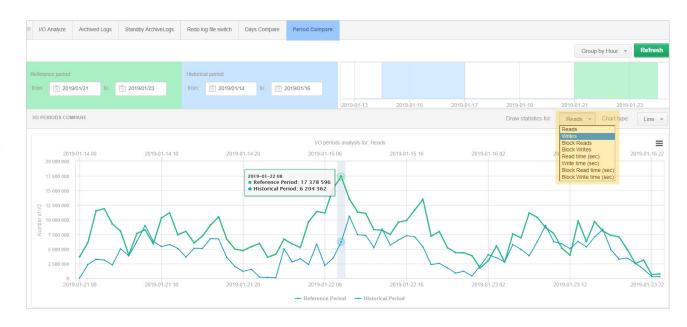

Compare Periods

The periods are compared by selecting the **reference** period and the **historical** period that we want to compare it with.

The comparison can be made for all available I/O meters.

The information is grouped in **daily** and **hourly** samples.
